Principles of Programming Languages: CS40032 Assignment-III: λ and Functors in C++

Arkajyoti Pal

February 10, 2019

```
1. (a)
            int age=25;
            auto func=[age](int val){cout<<(age-val);};</pre>
   (b)
            double var = 12.3;
            auto func=[&var](double val)
                 var += 1.0;
                 return ((int)(var+val));
            };
   (c) 4.3
       5.3
       5
       12
   (d) The code snippet, given as it is, would give a compilation error. Changing the line
            cout << l(5) << m(5) << endl;
       to
            cout << l(5) << "" << m(5) << endl;
       would solve the compilation error and give the following output:
       13
       14\ 13
   (e)
            #include <iostream>
            using namespace std;
            int main()
                 int c=3;
                 auto \operatorname{func} = [\&]() - > \operatorname{int}
                      ++c;
                      cout << c;
                      return 100.2;
                 };
```

```
func();
                                                        return 0;
                                        }
            (f) 4344
2. (a) \#include <bits/stdc++.h>
                        using namespace std;
                        class TowerOfHanoi {
                                        public:
